一、**淋病**：淋病是由淋菌引起，主要表现为尿道口流出脓性分泌物，伴有尿痛、尿急、尿频等。淋病的治疗通常采用抗生素，如头孢曲松钠、阿莫西林等。淋病的治疗期间，应避免性生活，以免交叉感染。

附記：丁巳上時即牛時(即丑時)：屬牛年，丁巳年上巳日(即丙申年三月初三日)：屬猴年。

Figure 6 | The effect of the concentration of the polymer solution on the morphology of the membrane. The feed solution was 0.5 wt% PEGDA in THF. The casting solvent was 90 vol% THF + 10 vol% EtOH. The casting temperature was 25 °C. The casting time was 1 h. The casting area was 10 cm × 10 cm. The casting thickness was 0.1 mm. The casting speed was 1 mm/min. The casting direction was from left to right. The casting surface was smooth. The casting surface was clean. The casting surface was free of defects. The casting surface was uniform. The casting surface was transparent. The casting surface was flexible. The casting surface was strong. The casting surface was durable. The casting surface was resistant to chemicals. The casting surface was resistant to heat. The casting surface was resistant to UV light. The casting surface was resistant to aging. The casting surface was resistant to mechanical stress. The casting surface was resistant to electrical stress. The casting surface was resistant to magnetic stress. The casting surface was resistant to acoustic stress. The casting surface was resistant to thermal stress. The casting surface was resistant to oxidative stress. The casting surface was resistant to reductive stress. The casting surface was resistant to acidic stress. The casting surface was resistant to basic stress. The casting surface was resistant to neutral stress. The casting surface was resistant to organic stress. The casting surface was resistant to inorganic stress. The casting surface was resistant to biological stress. The casting surface was resistant to environmental stress. The casting surface was resistant to all types of stress.

Sequence logo for the 10th position. The y-axis represents information content in bits, ranging from 0 to 0.4. The x-axis shows the 10th position. The logo indicates a strong preference for 'A' (Adenine) at this position, with a peak information content of approximately 0.35 bits.

Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG).

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses for all groups. The number of correct responses was significantly higher than the number of incorrect responses for all groups. The number of correct responses was significantly higher than the number of incorrect responses for all groups.

Figure 6. The effect of the number of iterations on the performance of the proposed algorithm. The figure shows the average fitness value (Y-axis) versus the number of iterations (X-axis). The fitness value starts at approximately 0.85 and decreases rapidly, stabilizing around 0.75 after about 100 iterations. The error bars indicate the standard deviation across multiple runs.

Table 1 *Demographic characteristics of the study population*

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).
